Note: This guide was created for Girls Who Code's Portfolio Social event, to customize your portfolio template created in the Intro to ReactJS Workshop created by Matt Wells. If you have not already created this template, check out the workshop recording here.

You can also check out our GWC member's portfolio creations on our GWC Portfolio Page and our code on our GWC Portfolio Codesandbox.

Starter Repo

Some additional comments have been made in the starter repo and are referenced in the following sections. If you have already created your template with the starter repo in the previous workshop, there is **no need to fork the repo again**, you can just look through it for the referenced comments and copy/paste them into your repo if you wish.

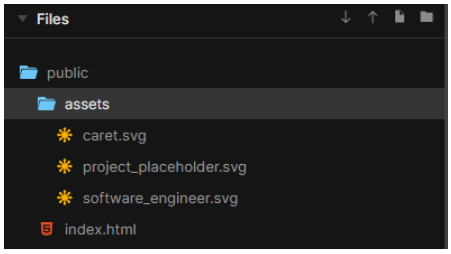

Components

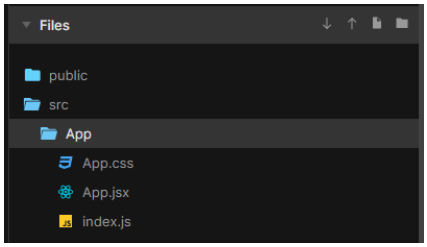

File Breakdown

The following is a brief run down of the folders and files you can use today. Feel free to keep exploring other files more on your own too!

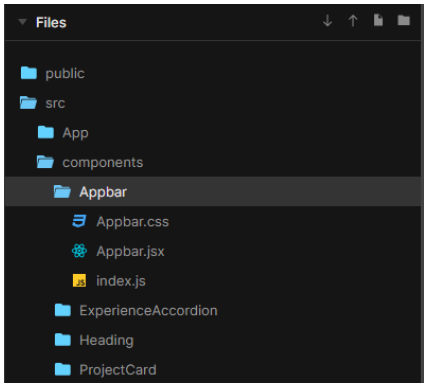

The **public** → **assets** folder is where you can add/remove images.

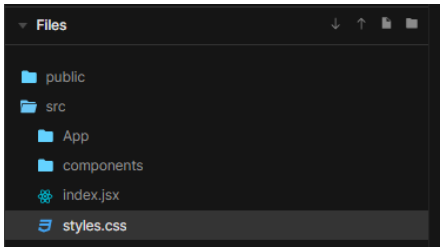

The **src** → **App** folder has all the files for your main content. **App.jsx** is where you will add the components you created and the text in the main top section of your portfolio page. **App.css** contains the main styling of the page as a whole.

The **src** → **components** folder contains all the components. Within each component's folder, the **.jsx** files have the code for the component structure itself while the **.css** files have the styling specific to that component.

The **src** → **styles.css** file contains all the main colors used on the portfolio page.

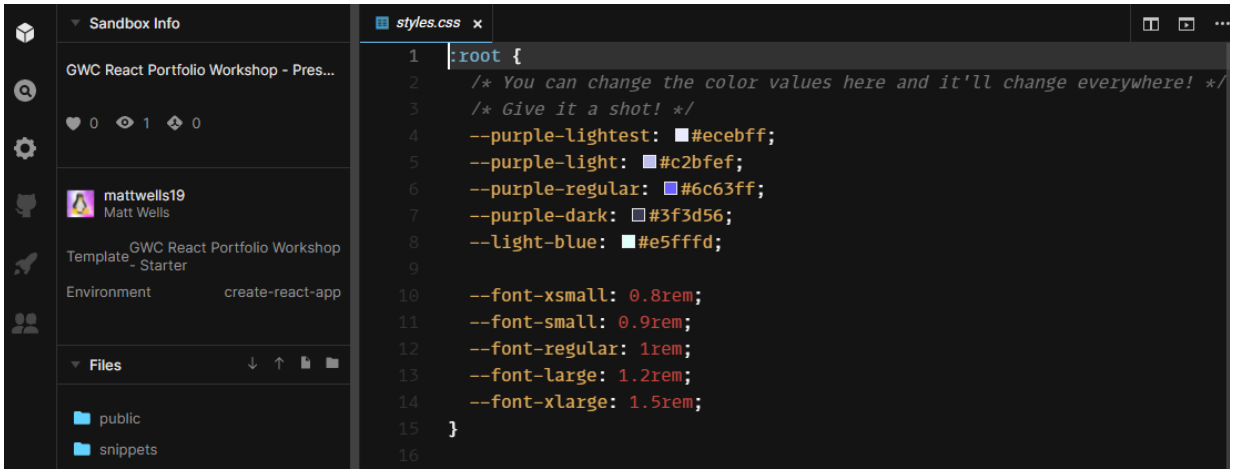

Change Colors

You can hover over the hex color code and a color picker will pop up. Use that color picker to play around with different colors, and you can notice where the colors change!

Feel free to also add comments to your code as you figure out where things are.

Main Colors

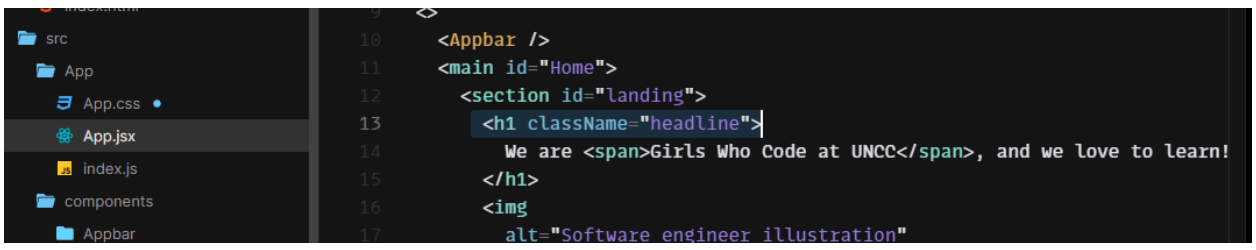

Main colors are located in **src → styles.css**
Side note: While you can easily just change the color value, you can also see that the colors have been named according to their current values. If you want to change their values, it is good practice to go back and rename them to make sense for your new colors. When you do this, you have to make sure they are also replaced anywhere they are used. (This is easier to do in an IDE like VS Code where you can do a quick search for terms in all files.)

Other Colors

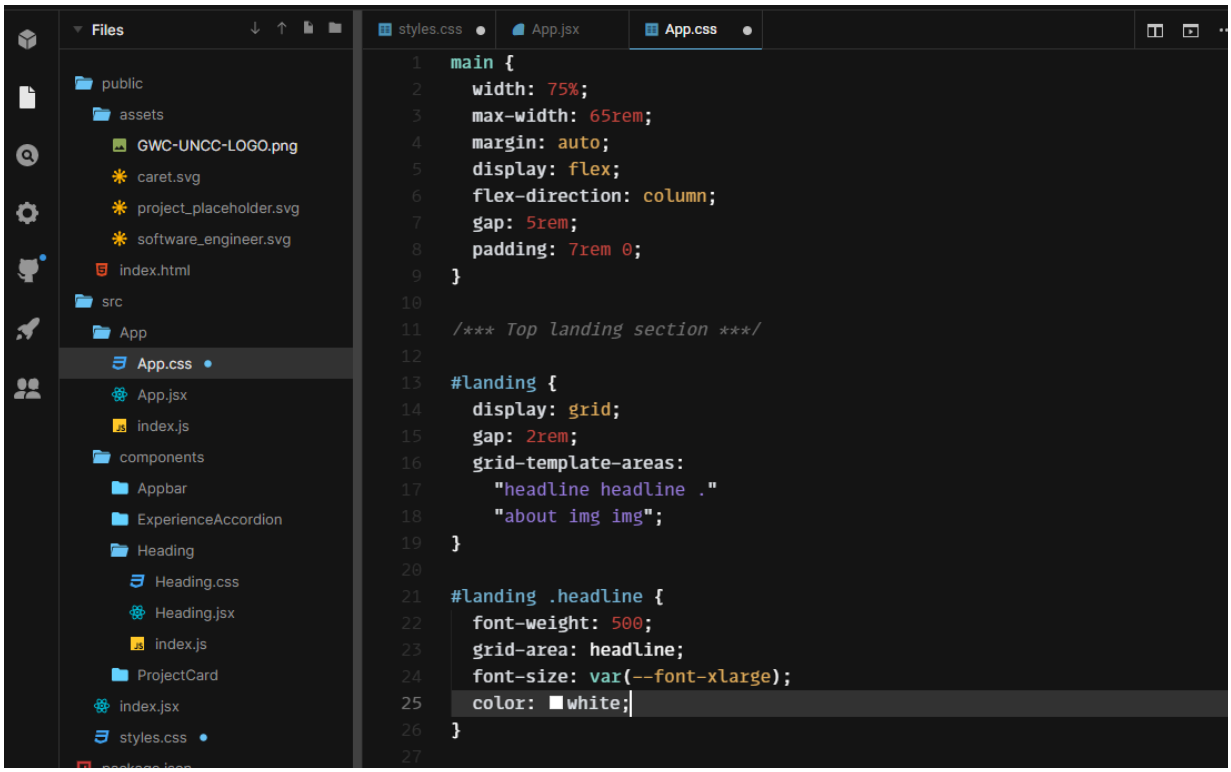

Specific colors, if applicable, are located in (or can be added to) their corresponding css files.
To find where you need to add/change more specific colors, look at the labels in the code. In the example below, we are looking at **src → App → App.jsx**

Here, let's say we made the top section of my portfolio have a dark background, so we need to make the text white. We can look at where the text is located in the code and see **`className="headline"`** and that is within an **`<h1>`** tag. We can also see a **`<section>`** tag that has **`id="landing"`**

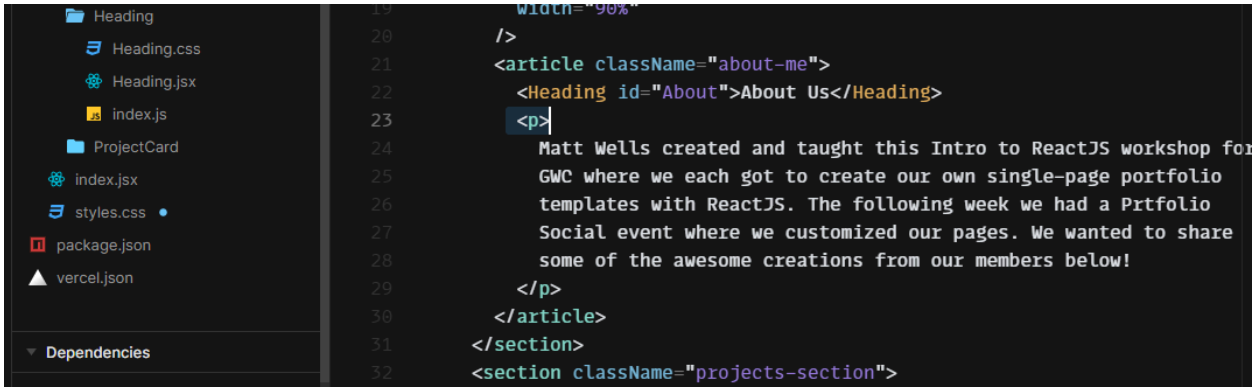

Then we can look in the corresponding css file **src → App → App.css**
Here we see a section with **`#landing`** and **`.headline`**, so we can try adding the change here. We can change text colors by using the format **`color: textcolor;`** If you want to change background colors, you can use **`background-color: color;`**

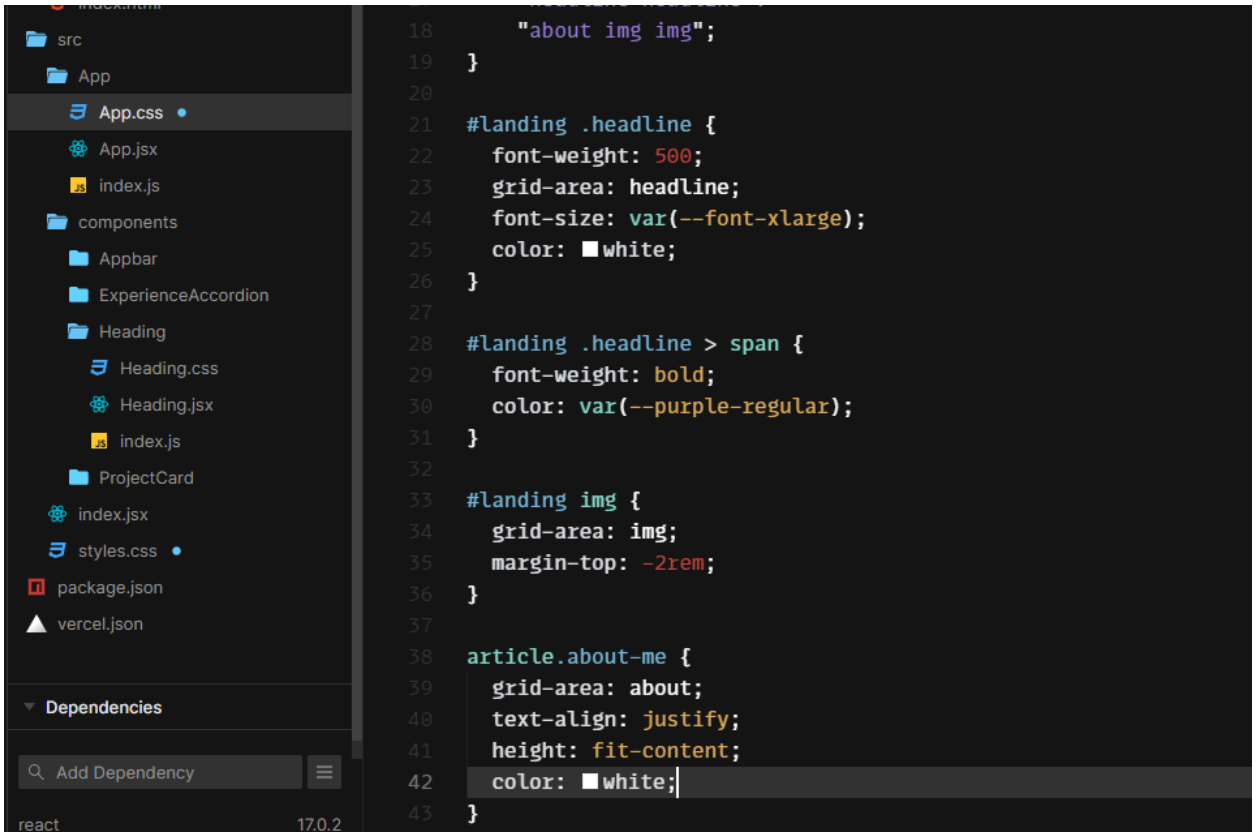

If you want to change other things, check out more on css here.

If you don't see a specific **`id`** or **`className`** for a section you want to change, look at the tags, ids, and classNames above it. For example, with the **`<p>`** text below, we can look at the tags above it.

Then we can find the corresponding sections in the css file, which in this case is **App.css**.

If you want to apply a color or style to a more specific area than is currently listed, try adding your own **`<div>`** tags with **`className`** or **`id`**. You can learn more about that here.

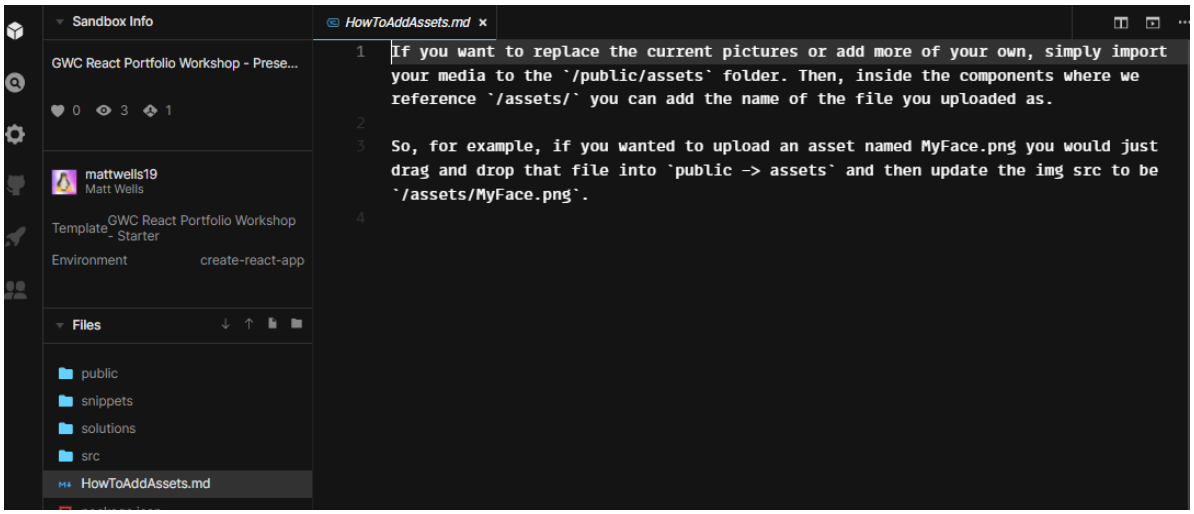

Note: In HTML, you typically use ***`class=" "`*** *versus here in React we used* ***`className =""`***

The key is to see what parts of the code are connected to certain parts of the template by playing around with it, so **give it a go!**

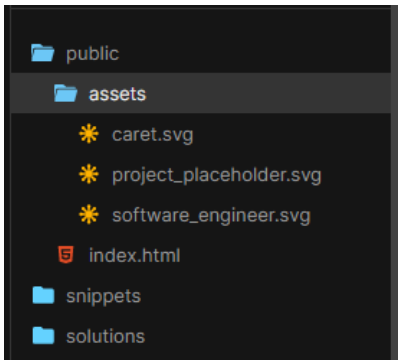

Images

Change Images

Instructions for adding new images can be found in **HowToAddAssets.md**

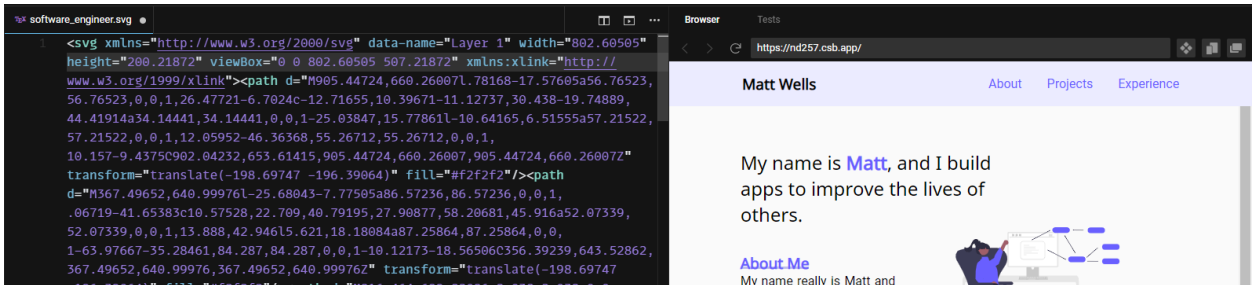

public → **assets** is where you will keep all your images, and you will update the name of the image being used where applicable.

Resize Images

The resizing built into this template should be fine for your images, but if you find yourself using an image with dimensions that aren't working well, there are some ways you can resize them.

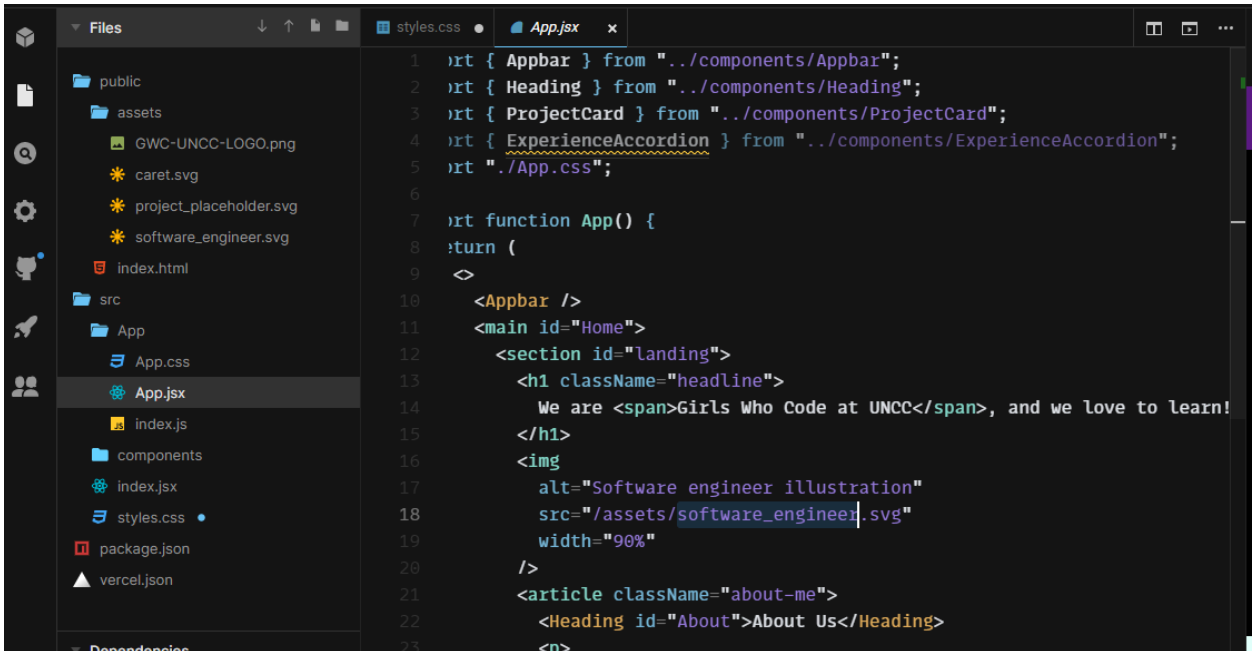

If you want to play with the sizing in the code for svg files, you can do that by clicking on the image in the left side panel to see code similar to below.

If you want to resize the image itself before adding it to your portfolio, there are free tools like Canva where you can specify dimensions of a canvas and enlarge/crop your image to fit those dimensions. More on that can be found in a previous workshop here.

Change Main Image

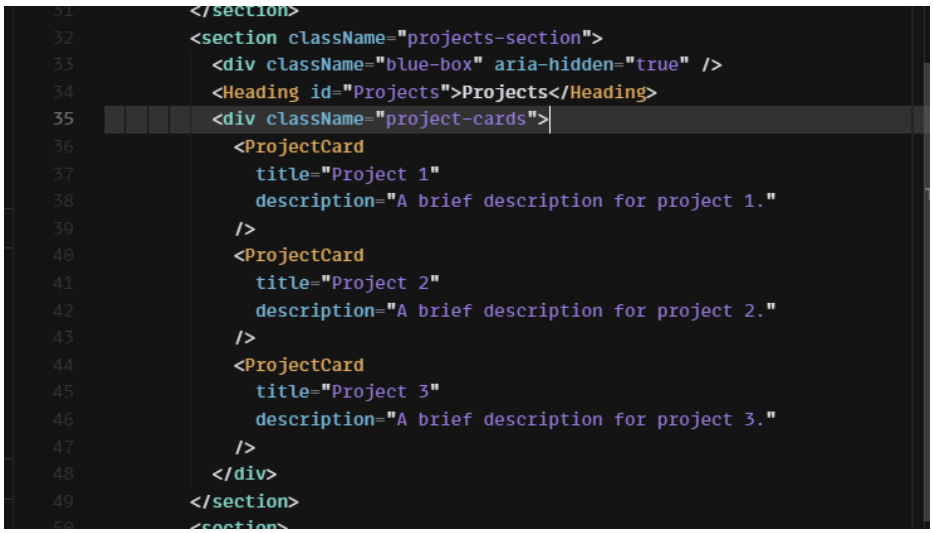

Below is an example of where you would change the image file name for the main image you see in the top section of the template.

Project Cards

Add Cards

To add more project cards, you can copy/paste an **`<ProjectCard/>`** section and paste it below the last one, staying inside of the ending **`</div>`** tag.

Flex-Wrap

If you want your project cards to automatically go on a new line depending on screen size, you can add the highlighted code to your **src** → **App** → **App.css** file.

```
/*** Projects section ***/

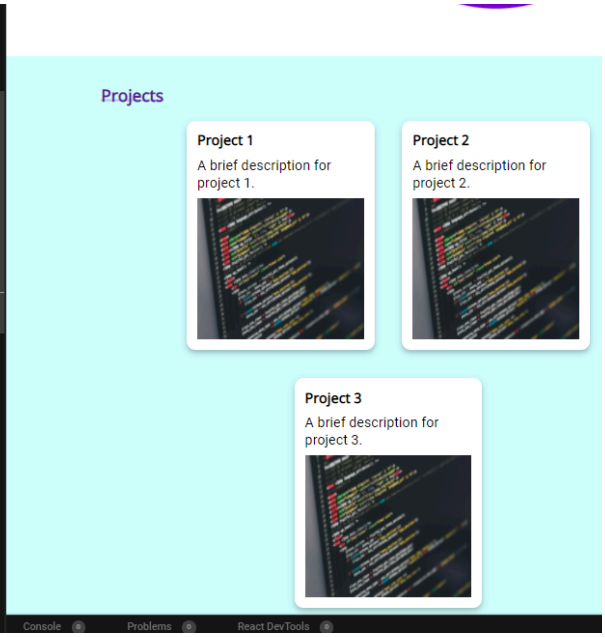

.projects-section {
  position: relative;
}

.blue-box {
  background-color: var(--light-blue);
  width: 200vw;
  position: absolute;
  transform: translateX(-50%);
  top: -2rem;
  bottom: -2rem;
}

.project-cards {
  z-index: 2;
  margin-top: 1rem;
  display: flex;
  gap: 2rem;
  justify-content: center;
  position: relative;
  /* ADDED! */
  flex-wrap: wrap;
}

/***********************/

/*** Experience section ***/
```

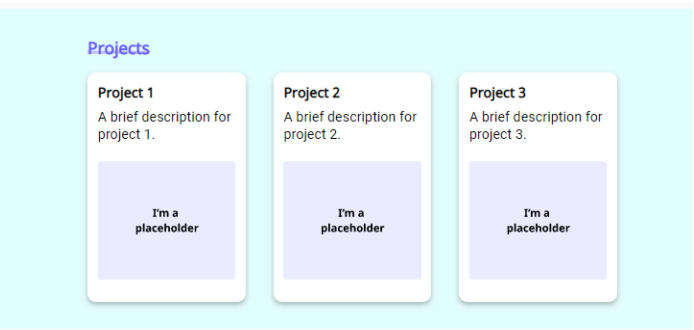

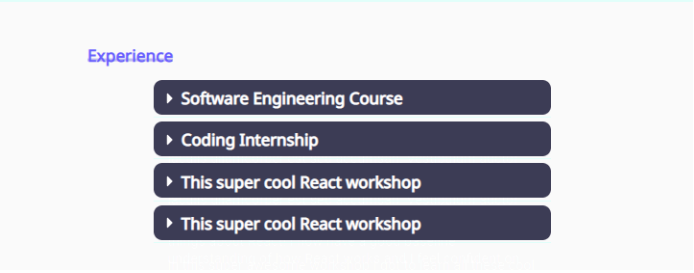

Experience Accordion

Add Accordions

To add more accordions, you can copy/paste an **`<ExperienceAccordion/>`** section and paste it below the last one, staying inside of the ending **`</div>`** tag

```
        <section>
          <Heading id="Experience">Experience</Heading>
          <div className="experience-accordions">
            <ExperienceAccordion
              title="Software Engineering Course"
              description="Nunc pulvinar aliquet luctus. Aenean a lobortis ipsu
            />
            <ExperienceAccordion
              title="Coding Internship"
              description="Nunc pulvinar aliquet luctus. Aenean a lobortis ipsu
            />
            <ExperienceAccordion
              title="This super cool React workshop"
              description="In this super awesome workshop I got to learn all th
            />
            <ExperienceAccordion
              title="This super cool React workshop"
              description="In this super awesome workshop I got to learn all th
            />
          </div>
        </section>
      </main>
    </>
  );
}
```

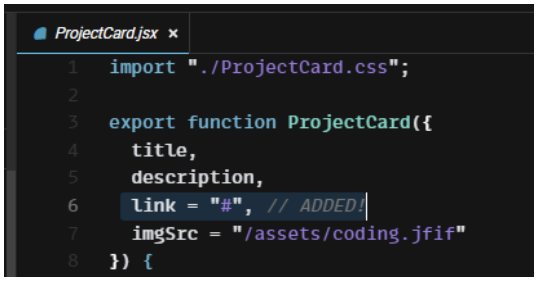

Add Links

Link Cards

Let's say you want to link a project card to your repo for that project, or a website/app you made. We can make that happen!

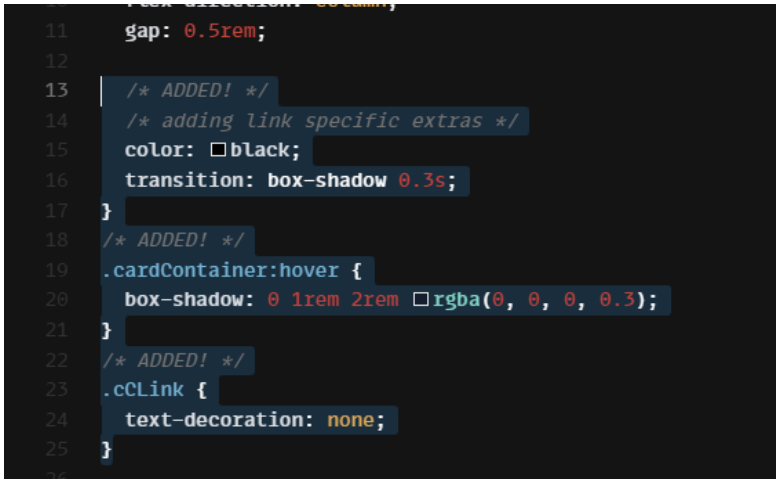

In **src** → **components** → **ProjectCard** → **ProjectCard.jsx**, add the highlighted line below.

In that same file, add the highlighted opening **<a>** tag and it's closing tag after the closing ** ** tag (shown on line 17).

In **src** → **components** → **ProjectCard** → **ProjectCard.css**, add the following highlighted code.

In **src** → **App** → **App.jsx**, try passing a link as shown below.

```
      </section>
      <section className="projects-section">
        <div className="blue-box" aria-hidden="true" />
        <Heading id="Projects">Projects</Heading>
        <div className="project-cards">
          <ProjectCard
            title="Project 1"
            description="A brief description for project 1."
            link="https://google.com"
          />
          <ProjectCard
            title="Project 2"
            description="A brief description for project 2."
          />
          <ProjectCard
            title="Project 3"
```

Now try hovering over the Project 1 card and then clicking it!

Link Text

If you want to add text to the bottom of your page, you can check out the code below! Here, in **src** → **App** → **App.jsx**, the **"here!"** is hyperlinked to our GWC linktree.

Note: The ` ` is an inserted space between the words "NinerEngage" and "here."
*The `<strong></strong>` makes **"here!"** bold.*

```
          </div>
        </section>
        <section>
          Check out more GWC events on our website or NinerEngage 
          <a
            href="https://linktr.ee/girlswhocode_uncc"
            rel="noreferrer"
            target="_blank"
          >
            <strong>here!</strong>
          </a>
        </section>
      </main>
    </>
  );
```

You can do this to text in the "About Me" section as well. Below, we have linked the "Girls Who Code at UNCC" to our linktree.

```
  return (
    <>
      <Appbar />
      <main id="Home">
        <section id="landing">
          <h1 className="headline">
            We are 
            <a
              href="https://linktr.ee/girlswhocode_uncc"
              rel="noreferrer"
              target="_blank"
            >
              <span>Girls Who Code at UNCC</span>
            </a>
            , and we love to learn!
          </h1>
          <img
            alt="Software engineer illustration"
```

If we don't want that link to be underlined, we can make some changes to the css file.
In **src** → **App** → **App.css**, we can add **> a** in front of **> span** to keep the text bolded.

```
#landing .headline > a > span {
  font-weight: bold;
  color: var(--purple-regular);
}
```

Below that, we can also add the highlighted code to remove the underlining of the text.

```
#landing .headline a {
  text-decoration: none;
}
```

Show it Off!

Girls Who Code at UNC Charlotte has participated in customizing a template too, and we want to share your work! Follow the steps below to get your work shown on our portfolio page that we will link in our event recap post on social media.

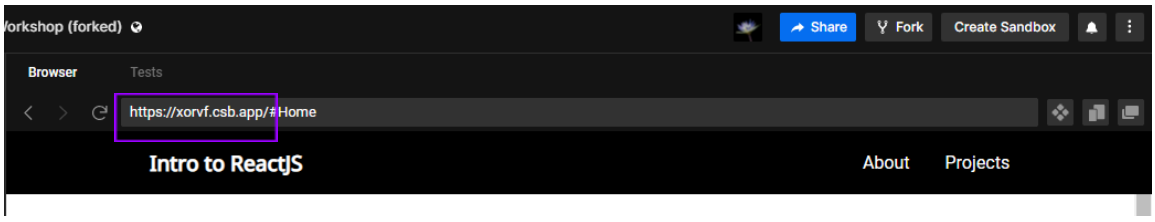

Please note that you have until **Monday, January 24th at 8:00pm** to be included, and rest assured your portfolio doesn't have to be perfect to go ahead and share it! What's important is that you learned to work with React JS, and you can always make changes to it later (doesn't change the link).

Prereqs

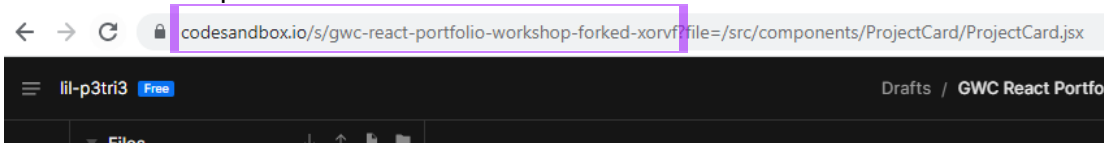

- You should have a GitHub account already from the previous workshop, but if you don't, go ahead and sign up. It's free!

Sharing Options

- If you want to show off your deployment with Vercel, share the live link
- If you want to share your portfolio without deploying, you can copy the link in the built in CodeSandbox browser
    - You can also test how that looks by clicking the button shown below

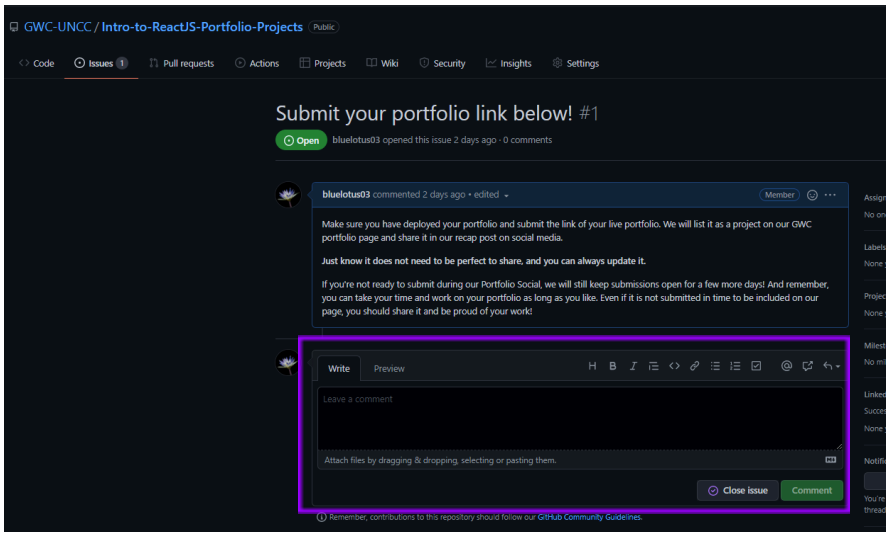

- If you'd rather just show your code and the built-in browser view, you can link to your CodeSandbox repo

Share Your Project

1) Go to https://github.com/GWC-UNCC/Intro-to-ReactJS-Portfolio-Projects/issues/1

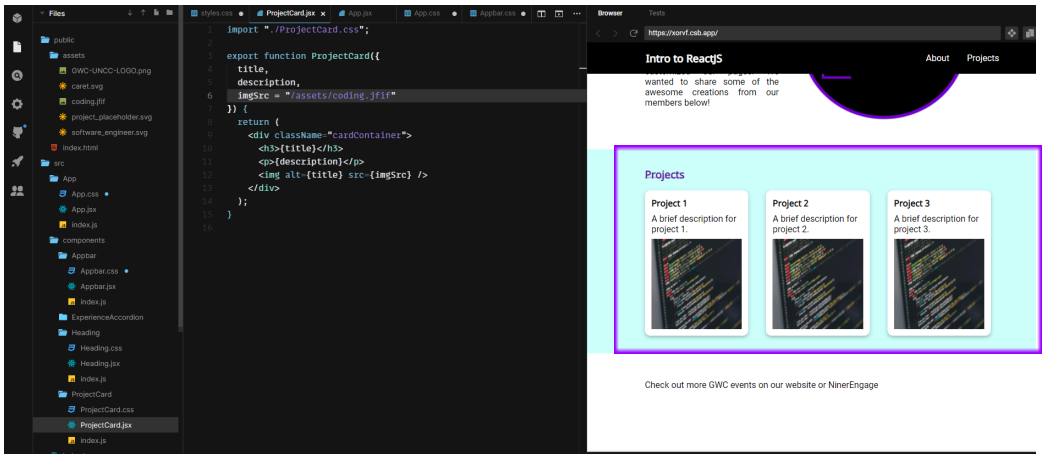

2) In the comment box, type **Your Full Name** and your **Project Link**
   Example: Ashley Harmon https://xorvf.csb.app/

3) Click **“Comment”**

   That’s it!

After the window closes on Monday, your project will be added on our page and shared in a recap post. So keep an eye out for the shoutout! :D

Extra

The following sections are just extra things you can try out if you want to!

Intro Paragraph

If you want to remove extra spaces in the “About Me” paragraph at the top of your page, you can remove the highlighted line in **src → App → App.css**

```
article.about-me {
  grid-area: about;
  text-align: justify;
  height: fit-content;
  color: rgb(0, 0, 0);
}
```

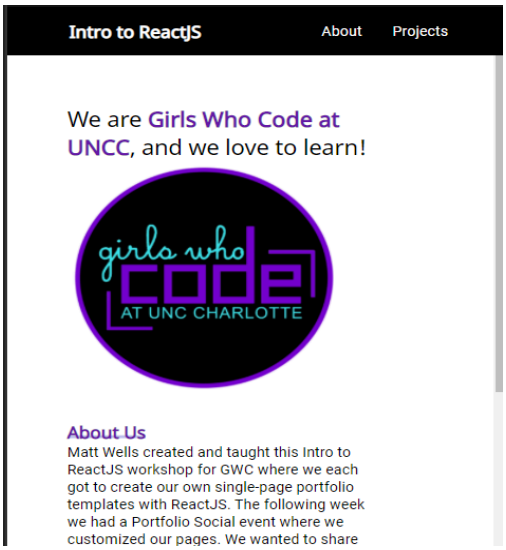

Main Image Size

Currently, when the screen size gets smaller, the main image stays next to the “About Me” paragraph text. If you want to have the main image go on top of the “About Me” text when it gets to a certain screen size, you can add the highlighted code below to the **src → App → App.css** file. Then you can see the image is now on top of the paragraph on a smaller screen.

```
#landing {
  display: grid;
  gap: 2rem;
  grid-template-areas:
    "headline headline ."
    "about img img";
}

@media (max-width: 33.75em) {
  #landing {
    grid-template-areas:
      "headline headline ."
      "img . ."
      "about . .";
  }
}

#landing .headline {
```

Anything Else?

If you end up trying other things, we’d love you to share them with us!
You can reach out to us on Instagram, LinkedIn, or Discord to share your work. Emails are always welcome too. We’d love to highlight it on our accounts and give you a shoutout!

Note: You must be a GWC member to be on our Discord server, but you can find any of our social media accounts and our email on our website: linktr.ee/girlswhocode_uncc
